

FIG. 159.—Six weeks after direct application of standard droplet of dichlorethylsulphide to cornea. Combined ectropion and entropion of upper lid with resulting "ruffling" of lid margin. Ectropion of lower lid. Organization of the necrotic cornea with extensive arborizations of newly formed blood vessels, best seen in the upper half of the cornea. Even in the photographs these can be traced from the sclera across the superior arc of the limbus to the central portion of the cornea. The same eye is shown in Figures 160 and 161
